**Part I**

**To DOS**

# Chapter 1

## Partitioning using Master Boot Record (MBR)

### 1.1 Introduction

#### 1.1.1 Intro

Master boot record is start of disk which says how disks sectors aka blocks are laid out.

## Chapter 2

# File systems including FAT32 (File Allocation Table)

### 2.1 Introduction

#### 2.1.1 FAT8

The table is a linked list of cluster locations. at end of linked list is end of file.  
cluster iss fixed amount of space. bitness is size of values linking to clusters.  
 $\text{max size} = \text{bitness} * \text{cluster size}.$

No garbage management or inodes.

#### 2.1.2 FAT12

Introduced after FAT8.

#### 2.1.3 FAT32

Introduced after FAT12.

## Chapter 3

# First-stage boot loaders and motherboard firmware, including BIOS

### 3.1 Introduction

#### 3.1.1 Introduction

The motherboard has the first-stage boot loader. This is firmware with its own read-only memory.

#### 3.1.2 Basic Input/Output System (BIOS)

## Chapter 4

# DOS fdisk

### 4.1 Introduction

#### 4.1.1 Introduction

Same name as util-linux program.

## Part II

# File systems, block devices and tools for partitioning and formatting drives

## Chapter 5

# File systems including ext2

### 5.1 Introduction

#### 5.1.1 Introduction

What they are. tree? heap? concept of mapping from path to file

#### 5.1.2 Garbage management of files

The link count is stored per file. If there are zero links to a file then the file system manager knows that the file can be deleted.

#### 5.1.3 inodes

Bad blocks are noted in inode1.

Root is inode 2.

inode 0 is null.

Within a partition, each file or folder has a unique inode.

Each partition divided into blocks. numbered from 0. Blocks are the minimum size for readable or writable operations. Changing a block means needing to read the whole block, making a change and then rewriting the block.

Files can be stored across many blocks. Block don't have to be next to each other.

Because a block is the minimum size of any operation, there can only be one file per block, and each file takes up at least one block.

File names are the property of folders.

**5.1.4 ext**

**5.1.5 ext2**

## Chapter 6

# Journalling file systems including ext4

### 6.1 Introduction

#### 6.1.1 Introduction

#### 6.1.2 ext3

#### 6.1.3 ext4

## Chapter 7

# Partitioning using Globally Unique Identifiers (GUID) Partition Table (GPT)

### 7.1 Introduction

#### 7.1.1 MBR and GPT

Drives are divided into sectors. Each sector contains a fixed number of bytes, eg 4096 bytes.

File systems can be partitioned using either MBR or GPT:

- Master Boot Record (MBR)
- Globally Unique Identifiers (GUID) Partition Table (GPT)

GPT is newer than MBR.

#### 7.1.2 Boot sectors

The first sector of a disk is the boot sector. This applies to both MBR and GPT.

GPT does not use the boot sector, and it is just kept for compatibility reasons. An EFI system partition is used instead, as discussed later.

## Chapter 8

# Partitioning drives with GNU parted and util-linux: fdisk and cfdisk, and lsblk, wipefs and fsck

### 8.1 Partitioning drives using util-linux

#### 8.1.1 Introduction

three options for partitioning are fdisk, gdisk and parted. parted generally seems the better option.

root partition if uefi, efi system partition (boot partition). also need boot partition if doing LVM or encryption on BIOS swap, though this is discussed later

#### 8.1.2 fdisk

Same name as DOS fdisk.

fdisk is designed with MBR in mind, but later versions have some GPT support:

- `fdisk -l` (list things in `/dev/`) (or can use `lsblk`)
- `fdisk /dev/sda` (or whatever correct device is)
- this opens dialogue:
  - “d” to delete partitions
  - create a new table, using MBR or GPT

- create partitions (can press "n" for new)
- make one bootable
- "w" to write"

### 8.1.3 cfdisk

Curses ndisk

### 8.1.4 lsblk

See devices in /dev/

### 8.1.5 fsck

Fix file system.

### 8.1.6 gdisk

gdisk is similar to fdisk but aimed at GPT (is it part of util-linux though?)

### 8.1.7 wipefs

## 8.2 GNU parted

### 8.2.1 parted

partitioning using parted:

- supports MBR and GPT
- different to fdisk? needed if drives over 2TB?
- parted -l (list things in /dev/) (or can use lsblk)
- parted /dev/sda (or whatever correct device is)
- this opens dialogue:
  - see status with "print"
  - type "quit" when done
  - make gpt using "mklabel gpt"
  - make mbr using "mklabel msdos"
  - make partitions: "mkpart". is interactive
  - make one bootable? "set [partition] boot on"

## Chapter 9

# Formatting partitions using util-linux: mkfs

### 9.1 Formatting drives

#### 9.1.1 Introduction

once partitions have been made, they show up on /dev/

#### 9.1.2 Making ext4 partitions

```
mkfs.ext4 /dev/<textless_root_partition>
```

#### 9.1.3 Making FAT partitions

also for grub boot?

```
mkfs.fat -F 32 /dev/<efi_system_partition>
```

#### 9.1.4 Swap

swap, though this is discussed later

## Part III

# UEFI and non-BIOS first-stage bootloaders, and second-stage boot loaders

## Chapter 10

# More first-stage boot loaders: UEFI and coreboot/libreboot

### 10.1 Introduction

#### 10.1.1 Unified Extensible Firmware Interface (UEFI)

Supports Secure Boot.

If `/sys/firmware/efi/` exists, the system is an EFI computer. Modern systems are UEFI rather than BIOS.

UEFI stores data in `.efi` file located in a hard drive, not a rom like in bios.

UEFI file stored in EFI system partition (ESP).

UEFI runs in 32/64 bit. BIOS in 16 bit. means uefi can support mouse and GUI.

UEFI supports disks over 2TB.

#### 10.1.2 Coreboot and Libreboot

#### 10.1.3 Android boot loaders

## Chapter 11

# The boot partition and second-stage boot loaders, including GRUB

### 11.1 Introduction

#### 11.1.1 Introduction

The first-stage bootloader, eg BIOS, looks for a second-stage bootloader to load on a disk.

The second-stage bootloader loads the linux kernel then runs "init".

#### 11.1.2 GRand Unified Bootloader (GRUB)

GRUB is a second-stage bootloader.

If the drive is partitioned using MBR, it is stored in the MBR.

With BIOS and GPT, there needs to be a separate boot partition for it. With UEFI and GPT, it can sit in the EFI partition.

### 11.2 Other

#### 11.2.1 GRUB config

There are config files associated with GRUB:

- /etc/default/grub
- /etc/grub.d/

## *CHAPTER 11. THE BOOT PARTITION AND SECOND-STAGE BOOT LOADERS, INCLUDING GRUB2*

Running `update-grub` can reflect changes in the boot path.

### **11.2.2 EFISTUB**

Allows EFI firmware to load kernel as EFI executable.

### **11.2.3 memtest**

Run `memtest` from `grub`

## Part IV

# Memory Mapping Units (MMUs):

## Part V

# Address Generation Units (AGUs):

**Part VI**

**Linux kernel**

## Chapter 12

# Loading the Linux kernel from the boot partition

### 12.1 Introduction

#### 12.1.1 Introduction

linux kernel hugepages + bigger than 4k standard + page table entry on linux  
memory + Translation Lookaside Buffer + transparent hugepages

linux kernel stuff: + i/o subsystem stuff around files: \* "generic block layer"  
\* "block device drivers" \* i/o scheduler + memory management subsystem \*  
virtual memory \* paging page replacement \* page cache + process management  
subsystem \* signal handling \* process/thread creation and termination \* process  
scheduler + IRQ (interrupt requests?) and dispatcher

## Chapter 13

# Directory layout on Linux: /boot, /sbin, /proc, /sys, /etc and /lib

### 13.1 Introduction

#### 13.1.1 Introduction

#### 13.1.2 /sbin

/sbin is where main binaries are stored.

#### 13.1.3 /proc

/proc has kernel files?

#### 13.1.4 /sys

#### 13.1.5 /lib

/lib has libraries for /sbin.

#### 13.1.6 /etc

/etc has conf?

## Chapter 14

# The init process, openrc and runit, and mounting using /etc/fstab

### 14.1 Introduction

#### 14.1.1 Introduction

/sbin/init /etc/init/ /etc/init.d/ /etc/inittab

#### 14.1.2 openrc

#### 14.1.3 runit

#### 14.1.4 /etc/fstab

Example from arch wiki:

# <device>	<dir>	<type>	<options>	<dump>	<fsck>
UUID=0a3407de-014b-458b-b5c1-848e92a327a3	/	ext4	noatime	0	1
UUID=f9fe0b69-a280-415d-a03a-a32752370dee	none	swap	defaults	0	0
UUID=b411dc99-f0a0-4c87-9e05-184977be8539	/home	ext4	noatime	0	2

Devices can also be eg /dev/sda2, but UUIDs safer.

dump refers to backing up disks

fsck says whether there should be a check first. 0 means no. 1 means 1 and is root. 2 means yes and is not root.

Options include:

+ rw (read and write) + suid (use set user IDs and group IDs from file system)  
+ dev ("Interpret character or block special devices on the filesystem") + exec  
(allow execution of binaries) + auto (can mount with -a) + nouser (don't allow  
normal user to mount) + async

The option "defaults" uses all of these

## Part VII

# User space

## Chapter 15

# Using swap partitions with util-linux: mkswap, swapon and swapoff, and swapfiles

### 15.1 Introduction

#### 15.1.1 Introduction

can use swap file or swap partition

mount swap:

+ need spare partition in partition table

```
mkswap /dev/<swap_partition>
```

```
swapon /dev/swap_partition
```

### 15.2 /etc/fstab

#### 15.2.1 fstab

Can add entry into /etc/fstab.

Eg:

```
UUID=device_UUID none swap defaults 0 0
```

### 15.3 swapfiles

#### 15.3.1 Introduction

## Chapter 16

# /dev/shm, /tmp and tmpfs

### 16.1 Introduction

#### 16.1.1 Introduction

## Part VIII

# Linux multi stuff?

## Chapter 17

# Batch processing

### 17.1 Introduction

#### 17.1.1 Introduction

multiple programs set to run one after another. virtual memory (and pages)  
here? something on segmentation faults

DOS is like this maybe?

# Chapter 18

## Interrupts

### 18.1 Introduction

#### 18.1.1 Introduction

Swap between processes (eg if user says to swap during, waiting for input, or printing). multi process needed for system management if even running 1 job? thread safety. address space layout randomisation. privilege. memory protection. avoiding deadlocks. job scheduler

## Chapter 19

# Concurrency control

### 19.1 Introduction

#### 19.1.1 Introduction

separate to parallel or multi threading. overlapping lifetimes of programs can cause

## Part IX

# Pseudo-character devices

## Chapter 20

# Pseudo-character device files

### 20.1 Introduction

#### 20.1.1 Introduction

character device file. just buffer for input buffer and output buffer. are fifo buffers. eg keyboard and printer of characters are character device files.

#### 20.1.2 Specifics

/dev/zero

/dev/null

/dev/random

/dev/urandom

/dev/tty\* + Terminals

/dev/pt\* + Pseudo terminals

/dev/lb\* + Line printers

/dev/fb\* + Frame buffers

## Chapter 21

# Loop devices

### 21.1 Introduction

#### 21.1.1 Introduction

`/dev/loop<x>`

**Part X**

**Shells**

## Chapter 22

Interactive login shells,  
read-eval-print loop  
(REPL), the Bourne shell  
implementations ash and  
dash, including commands:  
cd, fg, exit, jobs

### 22.1 Introduction

#### 22.1.1 Introduction

ctrl z to sleep

#### 22.1.2 jobs

”jobs” command to see sleeping jobs. can wake up with fg

#### 22.1.3 fg

wakes up sleeping things. (short for foreground)

#### 22.1.4 Introduction

shebang at top.

### 22.1.5 Pipes

|

### 22.1.6 Multiple jobs

multiple commands (&), trailing &,

### 22.1.7 Control flow

&&

||

control flow in sh (do while, case, for loop).

### 22.1.8 Writing to files

write to file with > (overwrite) and >> (append),  
direct stderr to stdout with 2>&1.

raise error?

### 22.1.9 Getting interactive input

getting input from user as part of script. doing so in password way to hide input.

### 22.1.10 Variables

defining variables.

env.

### 22.1.11 Functions

functions.

### 22.1.12 Passing variables to shell scripts

passing variables to sh script (-, -?)

### 22.1.13 xargs

### 22.1.14 Stream and batch data

stream vs batch data here or elsewhere?

### 22.1.15 Other commands

exit. sleep? timer?

## Chapter 23

# Keyboards and locales

### 23.1 Introduction

#### 23.1.1 Introduction

loadkeys

locale-gen function to eg set languages. see locale using "locale"

## Chapter 24

Other util-linux programs,  
including lscpu; more;  
mount and umount; dmesg;  
hwclock; kill; whereis; cal;  
fallocate; su; chsh

### 24.1 Introduction

#### 24.1.1 mount and umount

`mount /dev/<thing> /mnt/<name>`

can use `-mkdir`

`mount --mkdir`

#### 24.1.2 kill

#### 24.1.3 dmesg

Show kernel messages

*CHAPTER 24. OTHER UTIL-LINUX PROGRAMS, INCLUDING LSCPU; MORE; MOUNT AND UMOUN*

**24.1.4 more**

**24.1.5 whereis**

**24.1.6 cal**

**24.1.7 su**

run as different user

**24.1.8 hwclock**

**24.1.9 lscpu**

**24.1.10 fallocate**

**24.1.11 chsh and /etc/shells**

CChoose SHell.

Valid shells listed in /etc/shells

## Chapter 25

# Linux modules using kmod: lsmod, insmod, rmmod, modprobe and modinfo

### 25.1 Introduction

#### 25.1.1 Linux modules

mods are in `/lib/modules/`

#### 25.1.2 Linux module commands

Show loaded modules

`lsmod`

install mods

`insmod`

`rmmod`

load mod and dependencies

`modprobe`

Get information on a module

`modinfo`

## Part XI

# GNU coreutils: Basics

## Chapter 26

# GNU Core Utilities: Exploring folders using ls and dir, vdir, dircolors, du and stat

### 26.1 Introduction

#### 26.1.1 Introduction

#### 26.1.2 pwd

#### 26.1.3 ls and dir

#### 26.1.4 du

sizes of files in folder.

#### 26.1.5 stat

## Chapter 27

# GNU Core Utilities: Reading files using cat, tac, head and tail, and nl, od, base32, base64 and basenc

### 27.1 Introduction

#### 27.1.1 Introduction

#### 27.1.2 cat

#### 27.1.3 head and tail

head(first x lines)

tail(last x lines)

#### 27.1.4 nl

Number of lines. Prints file along with line number.

## Chapter 28

# GNU Core Utilities: Writing to files using cp, dd and install, mv, rm and shred, mkdir, rmdir, touch and ln, readlink, mknod, mkfifo, mktemp, sync, link, unlink, truncate, split and csplit

### 28.1 Introduction

#### 28.1.1 cp, dd and install

#### 28.1.2 mv

#### 28.1.3 rm and shred

#### 28.1.4 mkdir

#### 28.1.5 rmdir

#### 28.1.6 touch

#### 28.1.7 ln

#### 28.1.8 readlink

Expands symlinks.

## Chapter 29

# GNU Core Utilities: Reading and transforming text using tr, cut, split, ptx, sort, tsort, expand, unexpand and uniq, fmt, pr and fold

### 29.1 Introduction

#### 29.1.1 tr

#### 29.1.2 cut

#### 29.1.3 split

#### 29.1.4 sort

Sort lines of text files.

#### 29.1.5 uniq

Return unique lines only.

## Chapter 30

# GNU Core Utilities: Reading from multiple files using paste, comm and join

### 30.1 Introduction

#### 30.1.1 Introduction

## Chapter 31

# GNU Core Utilities: Summarising files with `wc` and checksums (`sum`, `cksum`, `b2sum`, `md5sum`, `sha1sum`, `sha224sum`, `sha256sum`, `sha512sum`)

### 31.1 Introduction

#### 31.1.1 Introduction

#### 31.1.2 `md5sum`

#### 31.1.3 `sha1sum`

#### 31.1.4 `sha256sum`

#### 31.1.5 `sha512sum`

#### 31.1.6 `crc32sum`

## Chapter 32

# GNU Core Utilities: Modifying command invocation with chroot (and jails), env, nice, nohup, stdbuf and timeout

### 32.1 Introduction

#### 32.1.1 Introduction

chroot (changes apparent root for processes, chroot jail?)

## Chapter 33

# GNU Core Utilities: Getting system information with df, date, uptime, uname, env, printenv, nproc, pwd, stty, tty, printenv

### 33.1 Introduction

#### 33.1.1 df

amount of Disk Free)

#### 33.1.2 date

#### 33.1.3 uptime

#### 33.1.4 uname

to get info on kernel etc

arch (same as uname -m)

*CHAPTER 33. GNU CORE UTILITIES: GETTING SYSTEM INFORMATION WITH DF, DATE, UPTIME*

**33.1.5 env and printenv**

**33.1.6 nproc**

## Chapter 34

# GNU Core Utilities: Maths with seq, factor and numfmt

### 34.1 Introduction

#### 34.1.1 Introduction

## Chapter 35

# GNU Core Utilities: Conditionals with test, expr, true and false

### 35.1 Introduction

#### 35.1.1 Introduction

## Chapter 36

# GNU Core Utilities: SELinux with runcon and chcon

### 36.1 Introduction

#### 36.1.1 Introduction

## Chapter 37

# GNU Core Utilities: Printing with echo, printf and yes

### 37.1 Introduction

#### 37.1.1 Introduction

## Chapter 38

# GNU Core Utilities: tee

### 38.1 Introduction

#### 38.1.1 Introduction

Send things to standard output and files (ie T pipe).

## Chapter 39

# GNU Core Utilities: sleep

### 39.1 Introduction

#### 39.1.1 Introduction

Sleep for specified time.

## Part XII

# Managing users and groups with shadow-utils

## Chapter 40

# Home directories in `/root` and `/home/!user!`

### 40.1 Introduction

#### 40.1.1 Introduction

`/root` is root home directory.

`/home/[user]` folders.

## Chapter 41

# **/etc/passwd and /etc/shadow, and shadow-utils:**

### **41.1 Introduction**

#### **41.1.1 Introduction**

#### **41.1.2 /etc/passwd**

Contains user names, full names, home directories and user shells.

Readable by anyone.

Used to contain hashes of passwords, but not anymore because vulnerable to dictionary attacks.

#### **41.1.3 /etc/shadow**

Contains user names and hashed passwords.

Only readable by root.

## Chapter 42

# Setting passwords and logging out with `logout` and `shadow-utils: passwd`

### 42.1 Introduction

#### 42.1.1 `passwd`

is file with info on users

`/etc/passwd`

contains hash of password: `/etc/shadow`

#### 42.1.2 `logout`

## Chapter 43

# Making and removing other users with shadow-utils: useradd and userdel

### 43.1 Introduction

#### 43.1.1 useradd

useradd

#### 43.1.2 userdel

userdel

what happens to files with user as owner?

## Chapter 44

# Using groups with shadow utils: usermod, usermod, groupadd, groupdel, groupmod, groups, gpasswd

### 44.1 Introduction

#### 44.1.1 Introduction

usermod to add user to group

users have primary group associated with just them, usually same name. can change using usermod.

groupadd, groupdel, groupmod, 777 etc. what happens to file when group deleted? command groups shows what groups a user is in

cont groups gpasswd to set passwords for groups. /etc/groups, /etc/gshadow

## Part XIII

# GNU coreutils: groups and users

## Chapter 45

# GNU Core Utilities: who and whoami, chmod, chgrp, chown, users, logname, id, groups, pinky

### 45.1 Introduction

#### 45.1.1 who

Who is logged in and what they are doing.

#### 45.1.2 whoami

## Part XIV

# Pluggable Authentication Modules (PAM)

## Chapter 46

# Pluggable Authentication Modules (PAM)

### 46.1 Introduction

#### 46.1.1 Introduction

## Part XV

# GNU findutils

## Chapter 47

# GNU findutils: xargs, find, locate, updatedb

### 47.1 Introduction

#### 47.1.1 xargs

#### 47.1.2 find

#### 47.1.3 locate

#### 47.1.4 updatedb

## Part XVI

# GNU text editors

# Chapter 48

## ed, ex and vi

### 48.1 ed

#### 48.1.1 Introduction

### 48.2 ex

#### 48.2.1 Introduction

### 48.3 vi

#### 48.3.1 Introduction

zz; ZZ

text folding.

#### 48.3.2 Input mode

exit with escape

#### 48.3.3 Basic editing

cursor before or after

i/a

new line above or below

O/o

undo

u

#### 48.3.4 Command mode

quit

:q

write and quit

:wq

quit without saving

:q!

vi has .swp files. swap files. recovery file for file being edited.

vi copy paste

#### 48.3.5 Opening other files

:e[dit] FILE\_PATH

:vi[sual] FILE\_PATH

## Chapter 49

# GNU nano

### 49.1 Introduction

#### 49.1.1 Introduction

## Part XVII

### procps

## Chapter 50

**procps with pgrep, pkill,  
pidwait, sysctl, free, top,  
watch, ps**

### **50.1 Introduction**

#### **50.1.1 Introduction**

#### **50.1.2 ps**

See processes one off then return to terminal.

#### **50.1.3 free**

free is different to top because dumps to out, not interactive.

”free -m” shows free memory. distinction between free memory and available memory. free memory often very low because linux uses ram where possible

## Part XVIII

# Other GNU programs

## Chapter 51

# GNU man-db: man and whatis

### 51.1 Introduction

#### 51.1.1 Introduction

#### 51.1.2 man

#### 51.1.3 whatis

one line version of man

# Chapter 52

## grep

### 52.1 Introduction

#### 52.1.1 Introduction

g/re/p (globally search for a regular expression and print matching lines) grep, egrep, fgrep

# Chapter 53

## sed

### 53.1 Introduction

#### 53.1.1 sed

minor scripting options but not central to concept. is regex thing.

## Chapter 54

# sudo, the /etc/sudoers file and disabling root login

### 54.1 Introduction

#### 54.1.1 sudo

## Chapter 55

# GNU which

### 55.1 Introduction

#### 55.1.1 Introduction

prints what would have been executed if the command was typed, with full path

**Part XIX**

**Scripting**

# Chapter 56

## awk

### 56.1 Introduction

#### 56.1.1 Introduction

rewrite grep as awk command as an example (action a return all, pattern is regex) can do patterns inside actions too *0returnwholeline1* return first col  
Maths in awk? rewrite sed in awk? rewrite cat etc in awk?

## Part XX

# Additional shells

## Chapter 57

# Bourne-Again Shell (bash), including commands: history

### 57.1 Introduction

#### 57.1.1 Introduction

#### 57.1.2 Prompt string

ps0/ps1/ps2/ps3/ps4

affect how terminal is presented:

ps0: what is displayed after command, before output ps1: what is displayed before command (most used customisation)

#### 57.1.3 bash\_history

contains history of bash commands

~/.bash\_history

#### 57.1.4 bashrc

~/.bashrc

can customise prompt strings here.

### 57.1.5 bashprofile

.bashprofile

## Chapter 58

# csh and tsch

### 58.1 Introduction

#### 58.1.1 Introduction

## Chapter 59

# ksh

### 59.1 Introduction

#### 59.1.1 Introduction

# Chapter 60

## zsh

### 60.1 Introduction

#### 60.1.1 Introduction

## Part XXI

# Archiving and compressing

## Chapter 61

# File archiving using GNU pax-archive: pax, tar and cpio

### 61.1 Introduction

#### 61.1.1 Introduction

Makes multiple files into a single file.

#### 61.1.2 pax

#### 61.1.3 tar

Tape archive

xvf flags to untar

#### 61.1.4 cpio

## Chapter 62

# Compression using GNU zip (gzip): gzip, gunzip and zcat

### 62.1 Introduction

#### 62.1.1 Introduction

#### 62.1.2 gzip and gunzip

#### 62.1.3 zcat

## Chapter 63

# tar and zip

### 63.1 Introduction

#### 63.1.1 tar

#### 63.1.2 zip

**Part XXII**

**Systemd**

# Chapter 64

## Systemd

### 64.1 Introduction

#### 64.1.1 Introduction

replaces init

systemd:

+ /usr/lib/systemd/system/ + /etc/systemd/system/

systemd init system (doesn't have runlevels)

/lib/systemd/system/nginx.service;

/etc/systemd/system/multi-user.target.wants/nginx.service;

/etc/inittab not on systemd

### 64.2 Replacing cron with systemd

#### 64.2.1 General commands

List installed

```
systemctl list-unit-files
```

```
systemctl status
```

running

```
systemctl list-units
```

```
systemctl daemon-reload
```

see if thing failed:

```
systemctl --failed
```

### 64.2.2 journalctl

see logs: journalctl (part of systemd?)

```
journalctl
```

### 64.2.3 Unit specific commands

```
systemctl status <unit>
```

```
systemctl help <help>
```

```
systemctl is-enabled <unit>
```

```
systemctl start <unit>
```

```
systemctl start <unit>
```

```
systemctl stop <unit>
```

```
systemctl restart <unit>
```

```
systemctl reload <unit>
```

Starts at boot, or starts now.

```
systemctl enable <unit>
```

```
systemctl enable <unit> --now
```

```
systemctl disable <unit>
```

```
systemctl reenabale <unit>
```

```
systemctl mask <unit>
```

```
systemctl unmask <unit>
```

```
systemctl edit <unit>
```

```
systemctl revert <unit>
```

## 64.3 Replacing GRUB with systemd-boot

### 64.3.1 systemd-boot

Alternative to GRUB which supports UEFI.

### 64.3.2 systemd-stub

## 64.4 The systemd implementation of /tmp

### 64.4.1 Introduction

## 64.5 Mounting with systemd

### 64.5.1 Introduction

systemd-gpt-auto-generator

systemd.automount

Requires GPT.

If using systemd, don't need to manually create swap for partition in /etc/fstab, systemd will find it by going through partitions

Doesn't replace /etc/fstab, but means don't need to include drives on GPT there, or swap.

## 64.6 systemd-cryptenroll

### 64.6.1 Introduction

Can manage physical security tokens and passwords for LUKS2.

## 64.7 systemd-homed

### 64.7.1 Introduction

Allows the creation of portable users.

## Part XXIII

# Alternatives to Systemd

# Chapter 65

## **cron**

### 65.1 Introduction

#### 65.1.1 Introduction
